Kava discussion prompts more debate

This is part three of a debate initiated after the closure of "Every Kangaii" (the Yatuma Institute for Ovina, Tuvalu) a series of meetings in the CI News on May 23, in which I suggested that discussion about kava be more open. I supported that argument by saying that it had been a "false debate" and not a debate at all. I suggested that the argument be clarified by a new discussion about kava and its traditional usage.

Space constraints have made this clarification seem to be in the middle of a discussion that was based on research by various others of various kinds of kava, which can be found in publications where we can do research. Before getting into a few of the kava misunderstandings, I will offer William's suggestion that the "three main points that are the question of the environment" of the Te Ao Moana include the nature of kava.

Kava is said to be an addictive drug. Kava is a natural product. Kava is said to be addictive in a manner similar to alcohol and marijuana. These two, through the question of the nature of kava, are not addictive in the same sense. Alcohol is addictive in terms of a number of factors, including its chemical structure and how it affects the body.

Some of the health and social issues associated with kava are not addictive in the same manner as alcohol. Alcohol is addictive in terms of a number of factors, including its chemical structure and how it affects the body.
